

Running the Go With The Flow GUI

Three steps to set up a computer. You only do this once; after that, step 3 is all you need.

Repository: <https://github.com/TerrenceCPierce/go-with-the-flow>

1

Install uv (a free tool that sets up Python for you)

Windows: open PowerShell and run:

```
powershell -ExecutionPolicy ByPass -c "irm https://astral.sh/uv/install.ps1 | iex"
```

Mac: open Terminal and run:

```
curl -LsSf https://astral.sh/uv/install.sh | sh
```

Close the window when it finishes.

2

Get the app folder

Go to [the repository](https://github.com/TerrenceCPierce/go-with-the-flow), click the green **Code** button, then **Download ZIP**. Unzip it somewhere easy to find, such as Documents.

If you use git instead:

```
git clone https://github.com/TerrenceCPierce/go-with-the-flow.git
```

3

Double-click the launcher for your computer

Windows	Run GUI.bat
Mac	Run GUI.command

The first launch downloads Python and the libraries (1–3 minutes, needs internet). After that it opens in a few seconds. **Leave the terminal window open** while you use the GUI.

Mac: if it says the file can't be opened, right-click it, choose **Open**, then click **Open** again. If it says you don't have permission, run this once in Terminal from that folder:

```
chmod +x "Run GUI.command"
```

The .bat file only works on Windows, and the .command file only works on Mac.

Data from each run is saved as a CSV file on your Desktop. For troubleshooting and details, see the Code Bible.
